This document consists of **19** printed pages and **1** blank page.

1 Two boys, X and Y, decide to measure the speed of some of the vehicles travelling along a road. The two boys stand 405 m apart beside the road, as shown in Fig. 1.1.

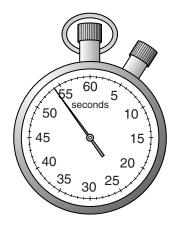

Fig. 1.1 (not to scale)

Boy X has a stopwatch which he sets to zero. As a vehicle passes boy Y, boy Y drops his hand as a signal to boy X to start his stopwatch. Boy X then stops the stopwatch as the vehicle goes past him.

The appearance of the stopwatch is then as shown in Fig. 1.2.

(a) How long did it take for the vehicle to travel from Y to X?

time =s [1]

(b) Calculate the average speed of the vehicle as it travels from Y to X.

average speed =[4]

(c)	The vehicle in (a) and (b) is	accelerating as	it travels from Y	to X.
-----	-------------------	--------------	-----------------	-------------------	-------

(i) How does its speed at X compare with that at Y?

Tick one box.

greater than at Y	
same as that at Y	
less than that at Y	

(ii) How does its speed at X compare with the average speed calculated in (b)?

Tick one box.

greater than average speed

same as average speed

less than average speed

2 Solids, liquids and gases have different properties. The list below gives some of them.

	completely fills the container
shape	fills the container from the bottom
	fixed shape
	move around, close together
molecules	move around, close together move around, far apart vibrate about a fixed position
	vibrate about a fixed position

Use descriptions from the list to complete the table. Any description may be used more than once if appropriate. Two spaces have been filled in to help you.

	shape	molecules	
(a) solid			[2]
(b) liquid		move around, close together	[1]
(c) gas	completely fills the container] [1]

[Total: 4]

oil	
solar energy	
tidal energy	
wind energy	

[4]

[Total: 4]

Here is a list of energy resources available to the world. Some of these are renewable and some are non-renewable.

In the first blank column, put a tick by any **two** resources that are renewable.

In the second blank column, put a tick by any **two** resources that are non-renewable.

renewable

non-renewable

3

coal

hydroelectricity

nuclear energy

4 An aluminium rod is cut into a longer section and a shorter section, as shown in Fig. 4.1.

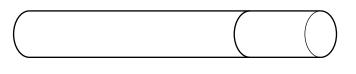

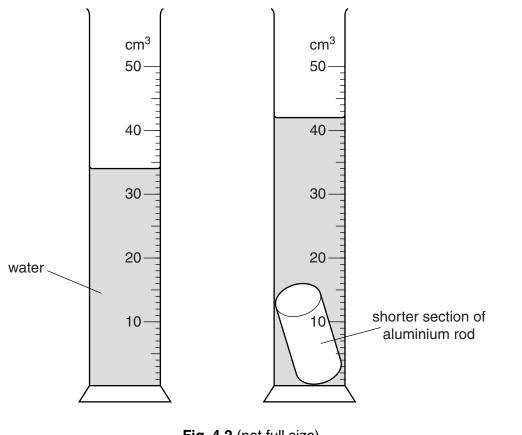

Fig. 4.1

(a) The shorter section of the rod is placed into a measuring cylinder containing water.

Fig. 4.2 shows the appearance of the measuring cylinder before and after this is done.

- Fig. 4.2 (not full size)
- (i) Calculate the volume of the shorter section of aluminium rod.

volume = cm^{3} [3]

(ii)	The mass of this shorter section is measured as 21.2g.	For Examiner's
	1. Name a laboratory instrument that might have been used to measure this mass.	Use
	[1]	
	2. Calculate the density of aluminium.	
	density =[4]	
(b) (i)	Name an instrument that could be used to measure the length of the longer section of aluminium rod.	
	[1]	
(ii)	Suggest a method, different from that in Fig. 4.2, that could be used to determine the volume of this longer section.	
	[2]	
	[Total: 11]	

For

Examiner's Use

5 (a) In Fig. 5.1, A and B are two parallel plane mirrors. A ray of light strikes mirror A at an angle of incidence of 45°. The ray then reflects, to strike mirror B.

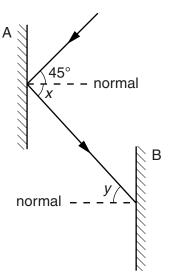

Fig. 5.1

- (i) State the name given to the angle *x* shown on Fig. 5.1.
 (ii) State the value of

 angle *x*,

 (iii) 2. angle *y*.
- (iii) On Fig. 5.1, use your ruler to draw the path of the ray after it leaves the surface of B. [1]

(b) The mirror B is now rotated so that it reflects the ray of light back along its original path. On Fig. 5.2, draw mirror B in the correct position to do this.

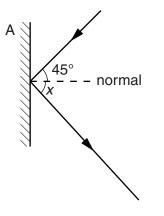

Fig. 5.2

For Examiner's Use

6 Some water in a glass beaker is heated from below, as shown in Fig. 6.1.

		Fig. 6.1	
(a)	Nar	me the process by which thermal energy is transferred	
	(i)	through the glass,	
	(ii)	throughout the water	[2]
(b)	the	thermal energy is supplied, the temperature of the water begins to rise. Althor supply of energy remains constant, eventually the temperature becomes stead out 80°C.	
	Sug	ggest why this happens.	
			[1]
(c)	aga	e rate of energy supply is increased. The temperature of the water begins to ain, but eventually becomes steady at a higher temperature. This time many bub seen throughout the water.	
	(i)	State what is now happening to the water.	
			[1]
	(ii)	What gas do the bubbles contain? Tick one box.	
		air	
		hydrogen	
		oxygen	
		steam	[1]
		[Tota	al: 5]

(a) S	State what is meant by the echo of a sound.
	[2]
	Describe how the echo of a sound may be demonstrated. Include a diagram that shows approximate sizes and distances.
c	liagram
C	lescription of method
•	
	[3]
~) 7	
	The demonstration in (b) is used to find the speed of sound in air.
(i) Which two measurements should be made?
	1
	2
	[2]
(i	
(i	[2]
(1	[2]
(i	 State how you would calculate the speed of sound from these measurements.

8 Fig. 8.1 represents the circuit that operates two of the lamps on a car.

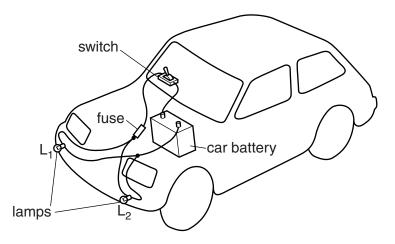

Fig. 8.1

(a) In the space below, draw the circuit diagram for this circuit, using conventional symbols.

[3]

(b) The car battery has an e.m.f. of 12V and, when the lamps are switched on, there is a current of 1.6A in each lamp.

Calculate the resistance of one of the lamps.

resistance =[4]

(c) When the switch is turned on, both lamps should light up. On one occasion when the driver operates the switch, lamp L₂ fails to light up. Suggest a reason for this.[1] (d) An amateur workman connects a length of wire across lamp L_2 and shorts it out. When the switch is closed for the first time after this, what happens, if anything, to (i) the fuse, (ii) lamp L₁, lamp L₂? (iii) [3]

[Total: 11]

9	(a)	Magnets A and B, shown in Fig. 9.1, attract each other.
---	-----	---

Fig. 9.1

The S pole of magnet A has been marked.

On Fig. 9.1, mark the polarities of the other poles, using the letters N or S. [1]

(b) A soft-iron rod and a steel rod each have coils around them. Both rods are initially unmagnetised. The coils are attached to circuits, as shown in Fig. 9.2.

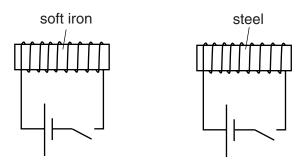

Fig. 9.2

(i) Use the following statements to complete the table referring to the soft-iron rod and the steel rod shown in Fig. 9.2.

magnetised loses its magnetism keeps its magnetism

	switch closed	switch open
soft iron		
steel		

[2]

For Examiner's Use

(ii) Which words apply to the force between the rods when the switches are closed?

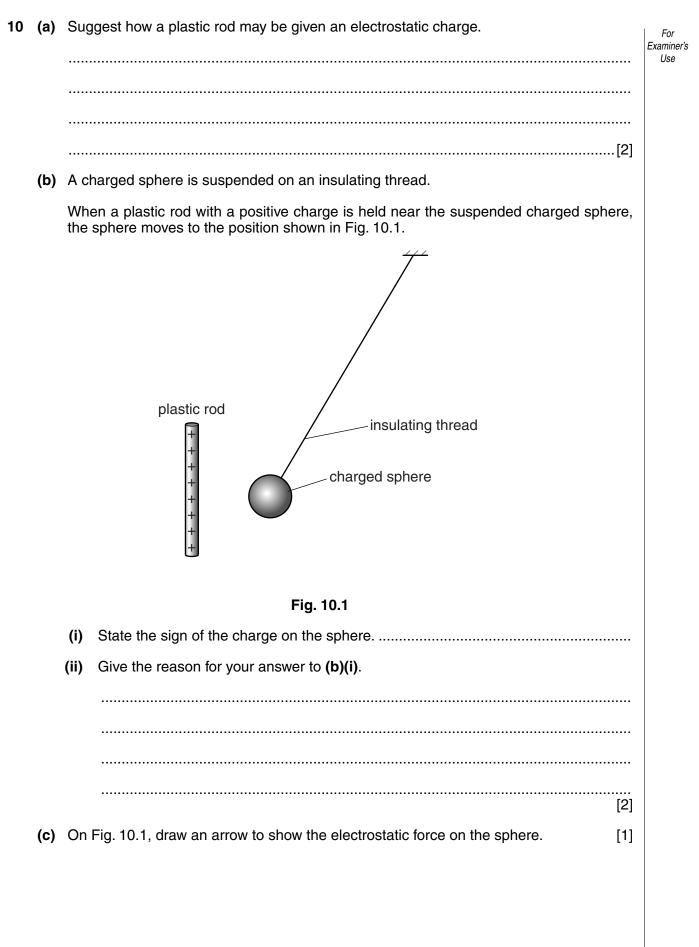

Tick one box.

no force
attractive force
repulsive force

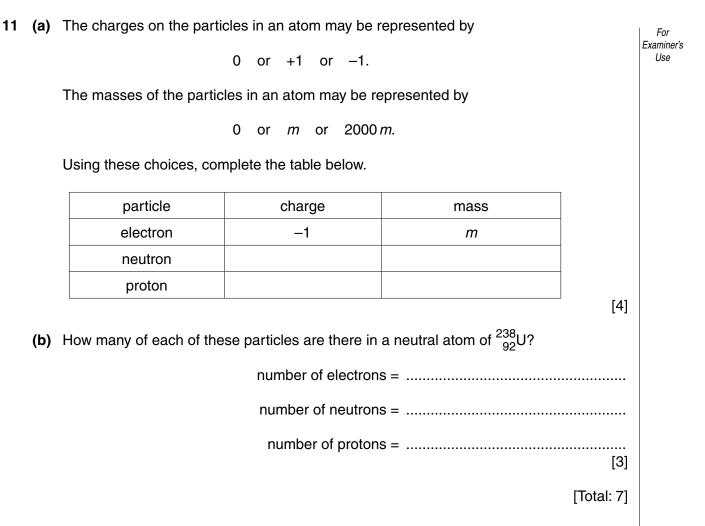

[1]

(iii) Which of the two arrangements in Fig. 9.2 would be used as the electromagnet on the crane in a scrap-metal yard?
 [1]
 (iv) State one advantage that an electromagnet could have in comparison with a similar-sized permanent magnet.
 [1]
 [1]
 [1]
 [Total: 6]

16

(d)	The positively-charged plastic rod is removed and replaced by a plastic rod with a negative charge.	For Examiner's Use
	Describe the position that the suspended sphere now takes.	038
	[Total: 6]	

- 1000 count rate counts/s 800 600 400 200-() 20 40 50 10 30 60 time/s Fig. 12.1 (a) From Fig. 12.1, find the time taken for the count rate to decrease from 1000 counts/s to 125 counts/s.
- **12** Fig. 12.1 shows the graph of the count rate from a radioactive source over a period of time. The readings have already had the background count rate subtracted.

For Examiner's Use

time = s [1]

(b) How many half-lives of the radioactive material were there during the time interval in (a)?

number of half lives =[1]

(c) From your answers to (a) and (b), calculate the half-life of the material.

half-life = s [2]

(d) On Fig. 12.1, sketch the curve that might have been plotted if the background count rate had **not** been subtracted. [1]
