### MARK SCHEME for the October/November 2013 series

# 9701 CHEMISTRY

9701/43

Paper 4 (A2 Structured Questions), maximum raw mark 100

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes should be read in conjunction with the question paper and the Principal Examiner Report for Teachers.

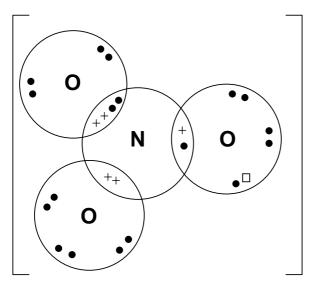

Cambridge will not enter into discussions about these mark schemes.

Cambridge is publishing the mark schemes for the October/November 2013 series for most IGCSE, GCE Advanced Level and Advanced Subsidiary Level components and some Ordinary Level components.

Page 2	Mark Scheme	Syllabus	Paper
	GCE A LEVEL – October/November 2013	9701	43

#### 1 (a)

dative bond to an oxygen using two N electrons	[1]
8 electrons around N in 1 double + 2 single bonds	[1]
a total of 24 electrons, including one, and <i>only</i> one " "	[1]
(the extra electron, " ", can be in a bond or a lone pair)	

[3]

## (b) (i) $2Mg(NO_3)_2 \longrightarrow 2MgO + 4NO_2 + O_2$ [1]

(ii)	(down the group) nitrates become more stable <i>or</i> are more difficult to decompose <i>or</i> need a higher temperature to decompose	[1]
	because there is less polarisation of the anion/nitrate ion/N–O bonds	[1]
	as radius of $M^{2+}$ /metal ion increases <i>or</i> charge density of the cation decreases	[1]
		[4]

(c) 
$$Cu + 4H^+ + 2NO_3^- \longrightarrow Cu^{2+} + 2NO_2 + 2H_2O$$

species [1] balancing [1]

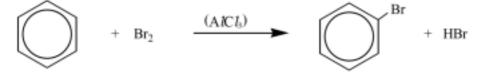

[2]

[Total: 9]

Page 3	Mark Scheme	Syllabus	Paper
	GCE A LEVEL – October/November 2013	9701	43
2 (a) any t	<i>to from</i> : molecules have negligible volume negligible intermolecular forces <i>or</i> particles are <i>i</i> <i>or</i> to the walls of the container random motion		
	no loss of <b>kinetic</b> energy during collisions <i>or</i> ela elastic molecules)	STIC COIIISIONS (N	2 × [1] [ <b>2</b> ]
(b) (i) la	w temperature <b>and</b> high pressure	bc	oth required [1]
<b>(ii)</b> (	at low T) forces between particles are more important,		[1]
(	at high P) volume of molecules are significant		[1]
			[3 max 2]

(c) (i) endothermic; because the equilibrium moves to the right on heating *or* with increasing temperature *or* because bonds are broken during the reaction [1]

(ii) e.g. halogenation or Friedel-Crafts alkylation/acylation

reactants [1] products [1]

other possibilities:  $Cl_2$ ,  $I_2$ , R-Cl, RCOCl etc.

[3]

#### Section B

7	(a)	(i)	Metals such as Hg, Ag, Cd, Pb, Cu (identified – NOT just "heavy metals")	
			(allow names, atomic symbols or ions, names or formulae of salts $- e.g. Pb(NO_3)_2$ )	
			<i>or</i> penicillin <i>or</i> organophosphorus insecticide etc.	[1]

(ii)	The ion/inhibitor binds to a part of the enzyme molecule away from the active site <i>or</i> to an allosteric site	[1]
	This changes the shape of the active site or denatures the enzyme	[1]
	OR the inhibitor forms a covalent/permanent bond with the active site	[1]
	blocking entry of the substrate	[1]

(iii)

- bioluminescence
- non-shivering thermogenesis **DNA** synthesis/reproduction

2 × [1] **[3]**
