CHEMISTRY 9701/52

Paper 5 Planning, Analysis and Evaluation

October/November 2009
1 hour 15 minutes

Candidates answer on the Question Paper.

No additional materials are required.

## **READ THESE INSTRUCTIONS FIRST**

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use a soft pencil for any diagrams, graphs or rough working.

Do not use staples, paper clips, highlighters, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer all questions.

You are advised to show all working in calculations.

Use of a Data Booklet is unnecessary.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [ ] at the end of each question or part question.

For Exam	iner's Use

Total	

This document consists of 10 printed pages and 2 blank pages.

A group of students use a number of different acids to investigate how the enthalpy change of neutralisation,  $\Delta H_{\rm neutralisation}$ , varies when the acids are neutralised with aqueous sodium hydroxide, NaOH.

For Examiner's Use

You may use the following information in answering the question.

The enthalpy change of neutralisation is the enthalpy change when 1 mol of water,  $H_2O$ , is formed in the neutralisation of an acid and base.

$$H^+(aq) + OH^-(aq) \rightarrow H_2O(aq)$$

Strong acids are 100% dissociated into ions in solution.

Weak acids are **not** 100% dissociated into ions in solution.

Breaking of bonds is an endothermic process.

Formation of bonds is an exothermic process.

(a)	Hydrochloric acid, nitric acid and sulfuric acid are all strong acids. Predict how $\Delta H_{\rm neutralisation}$ values for these acids would compare with each other.
	Predict and explain how the expected $\Delta H_{\rm neutralisation}$ for a weak acid, such as ethanoic acid or ethanedioic acid, compares with that obtained for hydrochloric acid.
	[2]
(b)	In a series of experiments to determine the enthalpy change of neutralisation for each acid with $2.0\mathrm{moldm^{-3}}$ sodium hydroxide, NaOH, the following aqueous acids are available.
	$\begin{array}{lll} \mbox{hydrochloric acid,} & \mbox{HC} l \\ \mbox{sulfuric acid,} & \mbox{H}_2 \mbox{SO}_4 \\ \mbox{nitric acid,} & \mbox{HNO}_3 \\ \mbox{ethanoic acid} & \mbox{CH}_3 \mbox{CO}_2 \mbox{H} \end{array}$
	Ethanedioic acid, $(CO_2H)_2.2H_2O$ , is also available as a hydrated crystalline solid.
	When determining the enthalpy change of neutralisation using the acids listed above in reaction with sodium hydroxide,
	the independent variable is,
	the dependent variable is[2]

(d) In each experiment 30.0 cm<sup>3</sup> of 2.0 moldm<sup>-3</sup> NaOH is to be used. There is to be an excess of sodium hydroxide, NaOH.

For Examiner's Use

Suggest appropriate volumes and concentrations for each of the acids to be used in the individual experiments.

In order that the experiments are equivalent, the total **final volumes** should be the same in each experiment.

acid		volume/ cm <sup>3</sup>	concentration /moldm <sup>-3</sup>
hydrochloric	HC1		
sulfuric	H <sub>2</sub> SO <sub>4</sub>		
nitric	HNO <sub>3</sub>		
ethanoic	CH <sub>3</sub> CO <sub>2</sub> H		
ethanedioic	(CO <sub>2</sub> H) <sub>2</sub>		

[3]

(e)	Ethanedioic aci	d is a hydrated	crystalline soli	id, (CO <sub>2</sub> H) <sub>2</sub> .2H <sub>2</sub> O.

Outline, step by step, how you would prepare, in a graduated flask, 250 cm $^{\circ}$ of a solution of ethanedioic acid with <b>exactly</b> the concentration you have given in the table above. [ $A_r$ : C, 12.0; H, 1.0; O, 16.0]
[4]

(f)	Show the mathematical expression for the enthalpy change of neutralisation of sodium hydroxide with hydrochloric acid, using the volume and concentration from (d) and $\Delta T$ to represent the temperature change.	For Examiner's Use
	[4.3 J of heat energy raise the temperature of 1 cm <sup>3</sup> of any solution by 1 °C.]	
	[1]	
(g)	Hydrochloric acid is labelled <b>harmful</b> as it is an irritant.  Aqueous sodium hydroxide is labelled <b>corrosive</b> .	
	Suggest a suitable precaution that should be taken when carrying out the experiment using these two solutions.	
	[1]	
	[Total: 15]	

2 If you have a container of gas with a tiny hole in the container, the gas will gradually escape through the hole. This is called **effusion**.

For Examiner's Use

The rate at which a gas **effuses** (escapes) is related to the relative molecular mass,  $M_r$ , of that gas. The time taken for a measured volume of gas to escape is called the **effusion time**.

A student investigates the **effusion time** for a number of **dry gases** using the following apparatus.

The instructions given to the student for the experiment are as follows.

- Attach two markers to the scale on the gas syringe, 70 cm<sup>3</sup> apart.
- Completely fill the syringe with the dry gas under investigation.
- Use the piston on the syringe to push all of the gas out of the syringe.
- Completely fill the syringe with the dry gas a second time.
- Clamp the syringe in an upright position, keeping hold of the piston of the syringe.
- Release the piston as it descends gas **effuses** from the small hole at the end of the effusion tube.
- Record the time taken for the piston to travel between the two marks.
- Repeat the experiment a number of times for each gas under investigation.

Mean times, to the nearest second, obtained by the student are given in the table below.

		M <sub>r</sub>	effusion time/s	$(M_{\rm r})^2$	√ <i>M</i> <sub>r</sub>
hydrogen	H <sub>2</sub>	2	19		
oxygen	02	32	76		
carbon dioxide	CO <sub>2</sub>	44	89		
butane	C <sub>4</sub> H <sub>10</sub>	58	102		
chlorine	Cl <sub>2</sub>	71	113		

(a) Complete the table above.

Calculate  $(M_{\bullet})^2$  to 3 significant figures.

Calculate  $\sqrt{M_r}$  to 4 significant figures.

[1]

**(b)** Plot the following graphs using data from the table.

(i) Effusion time against relative molecular mass,  $M_r$ .

For Examiner's Use

(ii) Effusion time against the square of the relative molecular mass,  $(M_r)^2$ .

For Examiner's Use 3 A group of students reduce samples of copper oxide by passing hydrogen gas over a weighed sample of the oxide contained in a porcelain boat.

For Examiner's Use

The results of the experiment are given below.

student	mass of porcelain boat/g	mass of boat + copper oxide/g	mass of boat + copper after heating/g		
1	5.55	7.71	7.11		
2	5.18	8.07	7.49		
3	5.17	10.05	9.07		
4	5.39	10.91	10.06		
5	5.46	11.64	10.40		
6	4.99	12.02	10.61		

- (a) Complete the table above to find, for each sample of the oxide,
  - (i) the mass of copper,
  - (ii) the mass of oxygen,
  - (iii) the mass of copper combined with 1.00 g of oxygen.

[2]

•	By making reference to the experimental method for reducing the copper oxide, explain a possible cause for this anomaly.	Exai
	[1]	
	From the results in <b>(a)(iii)</b> , calculate an appropriate mean for the mass of copper combined with 1.00 g of oxygen.	
	Show all your working, indicating clearly the results used in determining this mean value.	
	The mean mass of copper, combined with 1.00 g of oxygen is g [2]	
	Use your answer to <b>(c)</b> to determine the formula of the copper oxide. Show all your working. [ $A_r$ : O, 16.0; Cu, 63.5]	
	The formula of the copper oxide is [2]
