CHEMISTRY 9701/35

Paper 31 Advanced Practical Skills

May/June 2010

2 hours

Candidates answer on the Question Paper.

Additional Materials: As listed in the Instructions to Supervisors

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.

Give details of the practical session and laboratory where appropriate, in the boxes provided.

Write in dark blue or black pen.

You may use a soft pencil for any diagrams, graphs or rough working.

Do not use staples, paper clips, highlighters, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer all questions.

You may lose marks if you do not show your working or if you do not use appropriate units.

Use of a Data Booklet is unnecessary.

Qualitative Analysis Notes are printed on pages 14 and 15.

At the end of the examination, fasten all your work securely together. The number of marks is given in brackets [] at the end of each question or part question.

This document consists of 13 printed pages and 3 blank pages.

BLANK PAGE

1 You are required to find the molar enthalpy change for the decomposition of sodium hydrogencarbonate, NaHCO₃.

For Examiner's Use

$$NaHCO_3 \rightarrow \frac{1}{2}Na_2CO_3 + \frac{1}{2}H_2O + \frac{1}{2}CO_2$$

FA 1 is anhydrous sodium hydrogencarbonate. **FA 2** is anhydrous sodium carbonate. **FA 3** is 4.0 mol dm⁻³ hydrochloric acid.

You will determine the value for the molar enthalpy change of neutralisation for each of **FA 1** and **FA 2**, using an excess of **FA 3**. You will then use these values to calculate the molar enthalpy change for the decomposition of sodium hydrogencarbonate.

Warning: 4.0 mol dm⁻³ hydrochloric acid is an **irritant**.

Very rapid effervescence occurs when FA 1 or FA 2 are added to FA 3. For safe working, and to minimize the formation of 'acid mist', the solid must be added **carefully**, with stirring, to the acid. See further instructions below.

Before starting any practical work read through the instructions in (a) and draw up two tables to record your results.

(a) Determining the molar enthalpy change of neutralisation between FA 1 and FA 3

$$NaHCO_3 + HCl \rightarrow NaCl + H_2O + CO_2$$

Follow the instructions below to determine the temperature change when a known mass of **FA 1**, sodium hydrogencarbonate, reacts with an excess of **FA 3**, hydrochloric acid.

- Weigh the stoppered tube labelled **FA 1** containing sodium hydrogencarbonate.
- Use a 50 cm³ measuring cylinder to transfer 50 cm³ of **FA 3** into a 250 cm³ beaker.
- Stir the acid in the beaker with the thermometer. Record the temperature of the acid; this is the temperature at t = 0 min.
- Record the temperature each minute for 3 minutes.
- At t = 4 min, start to **carefully** add the weighed sample of **FA 1** to the acid.
- Add the solid in at least 4 or 5 portions to prevent excessive effervescence.
- While adding the solid stir the mixture constantly with the thermometer, but do not record the temperature.
- Continue to stir the mixture throughout the experiment.
- Record the temperature at t = 5 min, then every ½ **minute** until t = 8 min.
- Reweigh the tube labelled **FA 1**, its stopper and any residual sodium hydrogencarbonate.
- Empty and rinse the beaker and dry it using a paper towel.
- In one of your tables record the balance readings and the mass of **FA 1** added; in the second table record all measurements of time and temperature.

Table of results

[3]

(b) Graph plotting

For Examiner's Use

- 1. Plot a graph of temperature (y-axis) against time (x-axis) on the grid below.
- 2. Draw two straight lines of best fit; one through the points up to t = 3 min; the second through the points from t = 5 min to t = 8 min. Extrapolate both lines to t = 4 min.
- 3. From the extrapolated lines read the minimum and the maximum temperatures at t = 4 min. Record these values in the spaces provided below.
- 4. Determine the value for the temperature fall at t = 4 min.

The minimum temperature at t = 4 min is°C.

The maximum temperature at t = 4 min is°C.

The temperature fall, ΔT_1 , at t = 4 min is°C.

[4]

For Examiner's Use

Wo	rking should be shown in all calculations.
(i)	Use the equation below and the temperature fall, ΔT_1 , from (b) to calculate the change in heat energy during the reaction of FA 1 with FA 3 .
	change in heat energy = $50 \times 4.3 \times \Delta T_1$
	The change in heat energy = J.
(ii)	Calculate how many moles of FA 1 , NaHCO $_3$, were used in your experiment. [A_r ; C, 12.0; H, 1.0; O, 16.0; Na, 23.0]
	mol of FA 1 were used in the experiment.
(iii)	Calculate the enthalpy change when 1 mol of FA 1 reacts with an excess of the hydrochloric acid, FA 3 .
	This is the molar enthalpy change of neutralisation, $\Delta \mathbf{H}_{\text{neutralisation}}$ (NaHCO ₃). Make certain that your answer is given in kJ mol ⁻¹ and has the appropriate sign.
	$\Delta \mathbf{H}_{\text{neutralisation}}(\text{NaHCO}_3) = \dots \qquad \text{kJ mol}^{-1}.$ sign calculated value
(iv)	Explain the significance of the sign you have given in (iii) and how it is related to your experimental results.
	[3]

BLANK PAGE

(d) Determining the molar enthalpy change of neutralisation between FA 2 and FA 3

For Examiner's Use

$$Na_2CO_3 + 2HCl \rightarrow 2NaCl + H_2O + CO_2$$

Follow the instructions below to find the temperature change when a known mass of **FA 2**, sodium carbonate, reacts with an excess of **FA 3**, hydrochloric acid.

You are provided with two samples of sodium carbonate. You should use the sample labelled Na₂CO₃ in experiment 1 and the sample labelled FA 2 in experiment 2.

Experiment 1

- Enter all results in the table below.
- Weigh the stoppered tube containing sodium carbonate, which is labelled Na₂CO₃.
- Use a 50 cm³ measuring cylinder to transfer 50 cm³ of FA 3 into the rinsed and dried 250 cm³ beaker used in (a).
- Stir the acid in the beaker with the thermometer and record the temperature.
- Start to add **carefully** the weighed sample of Na₂CO₃ to the acid.
- As in the experiment in (a), add the solid in at least 4 or 5 portions to prevent excessive effervescence.
- While adding the solid stir the mixture constantly with the thermometer.
- Record the maximum temperature obtained during the reaction.
- Reweigh the tube labelled Na₂CO₃, its stopper and any residual sodium carbonate.
- Empty and rinse the beaker and dry it using a paper towel.

Experiment 2

- Enter all results in the table below.
- Weigh a clean, dry, boiling-tube.
- Weigh between 7.0 g and 7.5 g of **FA 2**, sodium carbonate, into the boiling-tube.
- Repeat the procedure in **experiment 1** and record the maximum temperature obtained when this mass of **FA 2** reacts with 50 cm³ of **FA 3**.
- Reweigh the boiling-tube and any residual sodium carbonate.

Results

	experiment 1	experiment 2
mass of tube + anhydrous sodium carbonate / g		
mass of empty tube / g		
mass of tube + residual sodium carbonate / g		
mass of anhydrous sodium carbonate / g		
initial temperature of acid / °C		
maximum temperature obtained / °C		
temperature rise, $\Delta \textit{T}_2$ / °C

` '		

For Examiner's Use

[5]

Wo	king should be shown in all calculations.
(i)	Use the equation below and the temperature rise, ΔT_2 , from (d) for experiment 1 to calculate the change in heat energy during the reaction of sodium carbonate with FA 3.
	change in heat energy = $50 \times 4.3 \times \Delta T_2$
	Change in heat energy =J.
(ii)	Calculate how many moles of sodium carbonate were used in your experiment 1 . $[A_{\rm r};~C,~12.0;~O,~16.0;~Na,~23.0]$
	mol of sodium carbonate were used in experiment 1 .
(iii)	Calculate the enthalpy change when 1 mol of sodium carbonate reacts with an excess of the hydrochloric acid, FA 3 . This is the molar enthalpy change of reaction, $\Delta \textit{H}_{\text{neutralisation}}(\text{Na}_2\text{CO}_3)$. Make certain that your answer is given in kJ mol ⁻¹ and has the appropriate sign.
	$\Delta \mathbf{H}_{\text{neutralisation}}(\text{Na}_2\text{CO}_3) = \dots \qquad \text{kJ mol}^{-1}.$ $\textit{sign} \qquad \textit{calculated value}$
(iv)	Explain the significance of the sign you have given in (iii) and how it is related to your experimental results.

(f) Calculating the enthalpy change of decomposition of FA 1, $\Delta H_{\rm decomposition}$ (NaHCO₃) Use your values for $\Delta H_{\text{neutralisation}}$ (NaHCO₃) and $\Delta H_{\text{neutralisation}}$ (Na₂CO₃) in the expression below to calculate a value for the molar enthalpy change of decomposition, $\Delta H_{\text{decomposition}}$ (NaHCO₃), for **FA 1**. $\Delta \boldsymbol{H}_{\text{decomposition}} (\text{NaHCO}_3) = \Delta \boldsymbol{H}_{\text{neutralisation}} (\text{NaHCO}_3) - \frac{1}{2} \Delta \boldsymbol{H}_{\text{neutralisation}} (\text{Na}_2 \text{CO}_3)$ $kJ \text{ mol}^{-1}$. $\Delta \mathbf{H}_{\text{decomposition}}(\text{NaHCO}_3) = \dots$ sign calculated value [1] (g) Evaluation An alternative method for the determination of $\Delta H_{\text{decomposition}}$ (NaHCO₃) gave a value of $+42.5 \,\text{kJ} \,\text{mol}^{-1}$. The value you have obtained may be significantly different from this value. Calculate the difference between your value of $\Delta H_{\text{decomposition}}$ (NaHCO₃) and that obtained by the alternative method. Record this difference below. Express this difference as a percentage of the alternative value. $difference = \dots kJ mol^{-1}$ percentage difference = % (h) Sources of error Describe **one** major source of error in this experiment. Suggest an improvement which would significantly increase the accuracy of the experiment. Explain why your suggestion would produce a more accurate value. description of major source of error suggested improvement explanation of why suggestion would increase experimental accuracy
