UNIVERSITY OF CAMBRIDGE INTERNATIONAL EXAMINATIONS  
International General Certificate of Secondary Education

**CO-ORDINATED SCIENCES**

**0654/05**

Paper 5 Practical Test

May/June 2005

**2 hours**

Candidates answer on the Question Paper.

Additional Materials: As listed in Instructions to Supervisors

**READ THESE INSTRUCTIONS FIRST**

Write your Centre number, candidate number and name on all the work you hand in.  
Write in dark blue or black pen in the spaces provided on the Question Paper.  
You may use a soft pencil for any diagrams, graphs or rough working.  
Do not use staples, paper clips, highlighters, glue or correction fluid.

Answer **all** questions.

The number of marks is given in brackets [ ] at the end of each question or part question.  
Chemistry practical notes for this paper are printed on page 12.

If you have been given a label, look at the details. If any details are incorrect or missing, please fill in your correct details in the space given at the top of this page.

Stick your personal label here, if provided.

| For Examiner's Use |  |
|--------------------|--|
| 1                  |  |
| 2                  |  |
| 3                  |  |
| <b>Total</b>       |  |

- 1 (a) (i) You are provided with an insect-pollinated flower.  
Place the flower on its side on the white tile and draw it in the space provided.

[1]

- (ii) Label a sepal on your drawing.  
What is the function of the sepal?

.....  
..... [2]

- (b) Using tweezers, carefully remove the sepals, petals and stamens and place them on your white tile.

- (i) Draw one petal and one stamen in the spaces below.

| petal | stamen |
|-------|--------|
|       |        |

- (ii) Label the anther on your drawing.

[3]

(iii) The length of the petal is the distance along it from the point where it is attached to the flower to the tip of the petal. Mark this point of attachment on your drawing with the letter **X**.

Measure the length of the petal on your diagram. .... mm

Now measure the length of this petal on the white tile. .... mm

(iv) Use the two lengths you have measured to calculate the magnification of your drawing.

.....  
.....  
.....  
..... [4]

(c) Describe one feature of your flower which makes it well-adapted to pollination by insects. Explain your answer.

feature .....  
.....  
explanation .....  
..... [2]

(d) The petals of some insect-pollinated flowers produce a sugar solution called nectar which attracts insects. Describe an experiment you could do to see if the flower petals contain a reducing sugar.

.....  
.....  
.....  
..... [3]

- 2 You are going to investigate the relationship between the deflection of a metre rule and the mass responsible for the deflection.

Fix a metre rule to the bench using a clamp or heavy weight so that 700mm of the rule extends beyond the edge of the bench. See Fig.2.1

Fig.2.1

- (a) Use the second rule to measure in millimetres the height,  $h_0$ , as shown in Fig.2.1, and record it in Fig.2.2.
- (b) Place a lump of plasticine or clay on the 950 mm mark of the rule, causing the rule to bend. Remove some plasticine, or add more, until the rule has deflected between 40 mm and 50 mm. The height,  $h$ , will now be between 40 and 50 mm less than  $h_0$ . Record this height of the end of the rule in the space below.

height of end of rule above the floor = ..... mm [1]

- (c) Remove the plasticine from the rule and divide it into four pieces, **approximately** equal in size.
- (d) Weigh one of these pieces to the nearest gram and record its mass in the table Fig. 2.2.

Place this weighed lump on the 950 mm mark on the rule. Measure and record the new height,  $h$ , in the table Fig. 2.2

- (e) Weigh a second piece of plasticine to the nearest gram.
- Record this mass in Fig. 2.2.
  - Add this piece of plasticine to the first. Find the height,  $h$ , when the total mass is placed on the 950 mm mark.
  - Record the height and the total mass in the table Fig. 2.2.
  - Repeat this procedure until you have five sets of readings of total mass and resultant height.

- (f) Complete Fig.2.2 by calculating the deflection of the rule each time i.e.  $h_0 - h$ .

| mass of each piece of plasticine/g | total mass/g | height $h$ of end of rule above floor/mm | total deflection $(h_0 - h)$ /mm |
|------------------------------------|--------------|--|----------------------------------|
| 0                                  | 0            | $h_0 =$                                  | 0                                |
|                                    |              |  |                                  |
|                                    |              |  |                                  |
|                                    |              |  |                                  |
|                                    |              |  |                                  |

Fig. 2.2

[6]

(g) Plot a graph, of total mass of plasticine (horizontal axis) against deflection. Draw a best straight line through your points.

(h) Read from your graph

(i) the mass of plasticine required to cause a deflection of 25 mm,

..... g [1]

(ii) the deflection caused by a 20 g mass.

..... mm [1]

(i) What, if any, is the relationship between the mass added and the deflection?

..... [1]

(j) If the plasticine had been placed at 750 mm instead of 950 mm, what effect would this have on your measurements of deflection?

.....  
..... [1]

- 3 You are going to measure the temperature rise when four different metals, **A**, **B**, **C** and **D** are reacted with hydrochloric acid.

Read all the instructions before starting the experiment.

- (a) Using a measuring cylinder, add 5 cm<sup>3</sup> of the dilute hydrochloric acid to a test-tube. Measure the temperature of the acid to the nearest 0.5 °C and record it in Fig.3.1. Add metal **A** to the acid and gently stir the mixture with the thermometer. Note the maximum temperature reached during a three-minute period and record any other observations in Fig.3.1.

Remove the thermometer and rinse it with water.

- (b) Repeat the procedure in (a), using the sample of metal **B**.
- (c) Repeat the procedure in (a) using the sample of metal **C**. You are advised to place the tube in the rack as soon as you have added the acid. Also test the gas given off with a lighted spill. Record the result of this test in the observations column of Fig.3.1.
- (d) Repeat the procedure in (a) using the sample of metal **D**.
- (e) Complete Fig. 3.1 by calculating the temperature rise in each case.

| metal    | temperature of acid/°C |         |                  | observations |
|----------|------------------------|---------|------------------|--------------|
|          | initial                | maximum | temperature rise |              |
| <b>A</b> |                        |         |                  |              |
| <b>B</b> |                        |         |                  |              |
| <b>C</b> |                        |         |                  |              |
| <b>D</b> |                        |         |                  |              |

Fig. 3.1

[8]

(f) Using the results of your experiments, answer the following questions.

(i) Name the gas given off in the reaction in (c) above.

..... [1]

(ii) Which metal is the most reactive with hydrochloric acid?

..... [1]

(iii) Give two reasons why you chose this metal.

1. ....

2. .... [2]

(iv) On the basis of the results you have obtained, place the metals in order of decreasing reactivity, i.e. the most reactive first.

..... [1]

(g) Another metal **E** does not react with acids. Given some aqueous copper sulphate, describe how you would show that **E** is more reactive than copper. You are not required to carry out this experiment.

.....  
.....  
.....  
..... [2]

## CHEMISTRY PRACTICAL NOTES

## Test for anions

| <i>anion</i>                                     | <i>test</i>  | <i>test result</i>                     |
|--|--|--|
| carbonate ( $\text{CO}_3^{2-}$ )                 | add dilute acid  | effervescence, carbon dioxide produced |
| chloride ( $\text{Cl}^-$ )<br>[in solution]      | acidify with dilute nitric acid, then add aqueous silver nitrate           | white ppt.                             |
| nitrate ( $\text{NO}_3^-$ )<br>[in solution]     | add aqueous sodium hydroxide then aluminium foil; warm carefully           | ammonia produced                       |
| sulphate ( $\text{SO}_4^{2-}$ )<br>[in solution] | acidify, then add aqueous barium chloride <i>or</i> aqueous barium nitrate | white ppt.                             |

## Test for aqueous cations

| <i>cation</i>                   | <i>effect of aqueous sodium hydroxide</i>                  | <i>effect of aqueous ammonia</i>                               |
|---------------------------------|--|--|
| ammonium ( $\text{NH}_4^+$ )    | ammonia produced on warming                                | –  |
| copper(II) ( $\text{Cu}^{2+}$ ) | light blue ppt., insoluble in excess                       | light blue ppt., soluble in excess giving a dark blue solution |
| iron(II) ( $\text{Fe}^{2+}$ )   | green ppt., insoluble in excess                            | green ppt., insoluble in excess                                |
| iron(III) ( $\text{Fe}^{3+}$ )  | red-brown ppt., insoluble in excess                        | red-brown ppt., insoluble in excess                            |
| zinc ( $\text{Zn}^{2+}$ )       | white ppt., soluble in excess giving a colourless solution | white ppt., soluble in excess, giving a colourless solution    |

## Test for gases

| <i>gas</i>                       | <i>test and test result</i>  |
|----------------------------------|------------------------------|
| ammonia ( $\text{NH}_3$ )        | turns damp litmus paper blue |
| carbon dioxide ( $\text{CO}_2$ ) | turns limewater milky        |
| chlorine ( $\text{Cl}_2$ )       | bleaches damp litmus paper   |
| hydrogen ( $\text{H}_2$ )        | 'pops' with a lighted splint |
| oxygen ( $\text{O}_2$ )          | relights a glowing splint    |
