

**MARK SCHEME for the May/June 2013 series**

**0417 INFORMATION AND COMMUNICATION  
TECHNOLOGY**

**0417/22**

Paper 2 (Practical Test A), maximum raw mark 80

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes should be read in conjunction with the question paper and the Principal Examiner Report for Teachers.

Cambridge will not enter into discussions about these mark schemes.

Cambridge is publishing the mark schemes for the May/June 2013 series for most IGCSE, GCE Advanced Level and Advanced Subsidiary Level components and some Ordinary Level components.

### Choosing your storage by: name

This is the third of our articles on building your “Crazy but Cool” computer. It may only be one of the articles we explored choosing a machine. Then we looked at cases and power supplies. This week we consider storage devices.

Page layout changes here

You will like the SATA connections as each drive has its own cable and your motherboard will have plenty of connectors. No need any more for those ribbon connectors and daisy chaining your devices! There is another choice you will have to make. SATA2 is being replaced by SATA3 – twice as fast data transfer! So, will you look for a SATA3 drive as your

Spellings corrected	1 mark
---------------------	--------

#### Get lots of storage

You have already, perhaps, a good size hard disk. When examining it you see that its connection is a parallel ATA system and your new motherboard only supports serial ATA connections. You “only” had a 500gb drive and now you think that as this was getting pretty full

you will need at least a terabyte of storage. If you are seriously gaming or streaming video you may find this gets full soon. This may seem incredible, but whenever we needed what seems to be an excessively huge amount of applications that will

#### Use an SSD for the OS

For your main storage you will probably use a mechanical hard drive which writes data to a series of “platters” and has a moving read/write head. There is nothing wrong with these devices, but for speed you might be thinking of solid state drives. These have no moving parts, so are more robust in moving environments such as laptops or tablets. They are also very fast as they use flash memory. The disadvantage of them is that they are much more expensive than mechanical hard disk drives.

---	--------

One choice you might consider is using a solid state drive for your operating system and applications. This will be much quicker and

Name, candidate number, Centre number

So, why not go all out for solid state storage? One reason is that even in this fantasy world of building a crazy but cool machine there are limits to finance and two 512gb SSD drives will probably cost more than the rest of the project together. Another reason is that currently SSDs are said to slow down rapidly when they have made a lot of writes to the disk. Controllers are being developed to “level” the wear and they are now said to be better at keeping to their original incredible speed. Hence the plan to use a small SSD for the operating system and programs, and a mechanical hard disk drive for data storage.

Here are examples of the cheapest storage devices per GB in our list.

Drives you might consider				
<u>Type of drive</u>	<u>Model</u>	<u>Capacity</u>	<u>Price</u>	<u>Price Per GB</u>
HDD	Samsung Spinpoint	2000	€129.99	€0.06
SSD	Corsair Force	120	€122.98	€1.02

You will find other combinations of hard disk and solid state technology. Some hard disk drives include a solid state cache to improve performance.

Here is a RAID configuration. You might combine disks for speed or security or both. In RAID0, the data is written across two disks as though they were one. This is called “striping”. This gives extra speed when writing to disk, but has the disadvantage that the loss of data on both disks. You will need to make sure you have regular backups of your data.

Full file path and candidates file name

RAID1 configuration mirrors the data on two discs. This gives the security of automatic backup as all data is recorded on both discs and if one disc fails, the other can take over.

For speed and security, RAID10 combines both striped and mirrored data using four disks. This now sounds a bit excessive for our gaming machine, but you might consider a pair of SSDs in RAID0 for your operating system.

Here are some fast solid state disk drives that you might consider for the system:

Model	Type	Gb_s	Capacity	Price
Samsung 830	SSD	6.0	128	€164.98
OCZ Agility	SSD	6.0	120	€129.99
Corsair Force	SSD	6.0	120	€122.98
OCZ Vertex	SSD	6.0	120	€144.98
Kingston HyperX	SSD	6.0	120	€149.98
Samsung 830	SSD	6.0	64	€89.99
OCZ Vertex	SSD	6.0	60	€83.99

Happy building! Next week we will have more options for a graphic card.

*Solid state drives - benefits*

- Very fast operating system start up
- Very fast read and write speeds
- Silent in operation
- Cool running
- No moving parts, so resistant to shocks
